AI-Assisted Skin Health Screening Report

Assessment ID: 44a6e2ed-9acb-4756-bcb2-f4353de1a034

Generated: 14 August 2026, 04:38 PM

IMPORTANT: This report is an AI-assisted screening summary and is NOT a medical diagnosis. The ML model prediction and AI assessment cannot replace evaluation by a qualified healthcare professional.

1. Image Screening Result

Model prediction	Basal cell carcinoma
Classification code	bcc
Model confidence	50.3%

7-Class Model Output Distribution

Class	Model output
bcc · Basal cell carcinoma	50.30%
nv · Melanocytic nevi	19.60%
bkl · Benign keratosis-like lesions	16.57%
df · Dermatofibroma	7.26%
vasc · Vascular lesions	3.09%
akiec · Actinic keratoses and intraepithelial carcinoma	1.92%
mel · Melanoma	1.25%

These are model output scores and are not medically calibrated disease probabilities.

The classification confidence represents the model's confidence in its predicted class. It should NOT be interpreted as the probability that the user has the corresponding disease.

2. Contextual Screening Assessment

Screening priority: Higher

Suggested next-step urgency: Prompt dermatology evaluation recommended

Summary: The screening assessment indicates a higher priority for professional evaluation due to the presence of concerning clinical features.

3. User-Provided Information

Question	Answer
Has the spot persisted as a sore that fails to heal?	It has been present as a non-healing sore for weeks or months
Roughly how long has this spot been present?	Less than 6 months
Have you noticed any recent change in the size, shape, or color of the spot?	Yes, the shape has become more irregular
Has the spot ever bled or produced fluid?	Yes, occasionally after minor irritation

4. AI Screening Assessment

Screening concern	Higher
Recommended urgency	Prompt dermatology evaluation recommended

Summary

The screening assessment indicates a higher priority for professional evaluation due to the presence of concerning clinical features.

Explanation

KNOWN: You have reported a lesion that has been present for less than 6 months, has developed an irregular shape, and occasionally bleeds after minor irritation. You also noted that it has persisted as a non-healing sore.

MODEL SIGNAL: The image classifier identified features that can be associated with basal cell carcinoma, though the confidence is moderate. **UNCERTAINTY:** An image-based screening tool cannot confirm a diagnosis. The reported symptoms, such as a non-healing sore and recent changes in shape, are important clinical indicators that require direct examination by a healthcare professional regardless of the model's output.

5. General Precautions

- Avoid picking, scratching, or attempting to remove the lesion
- Protect the area from further irritation or injury
- Keep the area clean and dry
- Limit sun exposure to the affected area while awaiting evaluation

6. Recommended Next Step

Please schedule an appointment with a dermatologist for a professional clinical examination. A doctor can perform a physical assessment and determine if a biopsy or further diagnostic testing is necessary.
