AI-Assisted Skin Health Screening Report

Assessment ID: 5cba377d-ee3f-4727-bda8-e470a36bf9b0

Generated: 14 August 2026, 07:40 PM

IMPORTANT: This report is an AI-assisted screening summary and is NOT a medical diagnosis. The ML model prediction and AI assessment cannot replace evaluation by a qualified healthcare professional.

1. Image Screening Result

Model prediction	Basal cell carcinoma
Classification code	bcc
Model confidence	50.3%

7-Class Model Output Distribution

Class	Model output
bcc · Basal cell carcinoma	50.30%
nv · Melanocytic nevi	19.60%
bkl · Benign keratosis-like lesions	16.57%
df · Dermatofibroma	7.26%
vasc · Vascular lesions	3.09%
akiec · Actinic keratoses and intraepithelial carcinoma	1.92%
mel · Melanoma	1.25%

These are model output scores and are not medically calibrated disease probabilities.

The classification confidence represents the model's confidence in its predicted class. It should NOT be interpreted as the probability that the user has the corresponding disease.

2. Contextual Screening Assessment

Screening priority: Moderate

Suggested next-step urgency: Routine dermatology evaluation recommended

Summary: The screening model identified a potential concern, and your personal history of suspicious mole removal warrants professional follow-up.

3. User-Provided Information

Question	Answer
symptom_bleeding_001	No, it has not
duration_001	Not sure
symptom_pain_itch_001	No, none of these
change_001	Not sure
history_skin_001	Yes, suspicious moles removed

4. AI Screening Assessment

Screening concern	Moderate
Recommended urgency	Routine dermatology evaluation recommended

Summary

The screening model identified a potential concern, and your personal history of suspicious mole removal warrants professional follow-up.

Explanation

KNOWN: You have a personal history of having suspicious moles removed. You have not noticed any bleeding, crusting, pain, or itching, and you are unsure about the spot's duration or recent changes. **MODEL SIGNAL:** The image classifier returned a result of 'Basal cell carcinoma' with 50.3% confidence. This is a screening signal, not a diagnosis. **UNCERTAINTY:** A single image cannot confirm a diagnosis. The model's confidence is moderate, and many benign skin conditions can mimic the appearance of skin cancer. Because you have a history of suspicious lesions, it is important to have this spot examined by a professional to ensure it is not a concern.

5. General Precautions

- Avoid picking, scratching, or irritating the spot.
- Protect the area from direct sun exposure.
- Monitor the spot for any new changes in size, shape, or color.
- Take a clear photograph of the spot now to help track any future changes.

6. Recommended Next Step

Schedule an appointment with a dermatologist for a clinical evaluation. A professional can perform a physical examination and determine if a biopsy is necessary to reach a definitive diagnosis.
